

The New Color of Money Safer. Smarter. More Secure.

Coming Next ... a newly redesigned U.S. \$10 Note.

Following the successful introduction of the U.S. \$20 and \$50 notes that have been redesigned over the last two years, the U.S. government is now slated to redesign the \$10 note. The newly redesigned \$10 note is scheduled to be issued by the Federal Reserve in early 2006.

Similar to the new \$20 and \$50 notes' designs, the updated \$10 note will feature enhanced security features, subtle background colors and American symbols of freedom.

The U.S. government will work closely with banking institutions worldwide to ensure that the new \$10 note's entry into markets is a smooth transition. The \$100 note is also slated to be redesigned, but a timetable for its introduction is not yet set. As has been the tradition with U.S. currency, all old designs will remain in circulation and maintain their full face value.

The BEP has been working with the cash-handling industry regarding the new design and, in March 2005, a number of manufacturers brought their equipment to the Bureau to sample test notes. This advance testing allows the manufacturers of vending machines, ATMs and other machines that receive and dispense cash, mainly in the U.S., to make technical adjustments to their equipment before the note goes into circulation.
